

What is claimed is:

1. A print control method for transmitting print data from a client to a print server managing a printer so as to
5 print by the printer in a network environment, the method comprising the steps of:

using HTTP as a communication protocol between the client and the print server;

10 in the client, adding a header including information about the printer to be used to the print data so as to transmit the print data;

in the print server, receiving the print data and transmitting the print data to the printer in accordance with the header of the print data; and

15 in the printer, printing the print data.

2. A print control method for printing by a printer managed by a print server in a network environment, the method comprising the steps of:

20 adding a header including information about the printer to be used to the print data;

in the print server, receiving the print data from a client requesting for print using HTTP as a communication protocol;

25 transmitting the print data to the printer in accordance with the header of the print data;

in the printer, printing the print data.

3. The print control method according to claim 2, wherein the transmitting step includes the step of removing the header of the print data in the print server before
30 transmitting the print data to the printer.

4. The print control method according to claim 2, further comprising the steps of monitoring the state of the printer and generating a hypertext describing the state of the printer in the print server.

5. The print control method according to claim 2, further comprising the steps of memorizing printer information such as an address, a type and a protocol of the printer for each printer and generating the hypertext describing the printer information in the print server.

6. The print control method according to claim 2, further comprising the steps of memorizing the printer information in the printer and acquiring the printer information using SNMP as a communication protocol so as to monitor the state of the printer in the print server.

7. A print server for managing a printer in a network environment, comprising:

HTTP receiving means for receiving print data using HTTP as a communication protocol; and

print data transmitting means for transmitting the print data to a printer as an output target in accordance with a HTTP header of the print data.

8. The print server according to claim 7, further comprising printer monitoring means for monitoring the state of the printer, printer information managing means for managing printer information such as an address of the printer, a type of a device and the communication protocol, printer information memorizing means for memorizing the printer information for each printer, first hypertext generating means for generating a hypertext describing the state of the printer, second hypertext generating means for

generating a hypertext describing the printer information, and the print data transmitting means removing the header of the print data before transmitting the print data to the printer.

5 9. A client comprising:

printer registering means for registering and managing printer information acquired from a print server managing a printer, the printer information including an address of the printer, a type of the printer and a communication

10 protocol;

display means for displaying the printer information on a display screen;

selecting means for selecting the printer to be used from the printer registering means; and

15 HTTP transmitting means for adding a header including information about the address of the printer selected by the selecting means to print data and for transmitting the print data to the print server.

20 10. A recording medium that can be read by a computer having a WWW server function, the recording medium storing a program comprising the steps of using HTTP as a communication protocol so as to receive print data from a client and transmitting the print data to a printer designated by the client.

25 11. A print control system in a network environment, comprising;

a HTTP server for receiving data using HTTP as a communication protocol;

30 a print server for managing a printer, including means for memorizing printer information such as

an address, a type and a protocol of the printer for each printer,

means for generating a hypertext describing the printer information, and

5 means for transmitting the hypertext to a client;
and

the HTTP server including

means for receiving print data from the client,
the print data including a HTTP header designating a
10 printer to be used in accordance with the printer
information, and

means for transmitting the print data to a
printer designated by the HTTP header.
